

Hard to reproduce, easy to inspect: IDEMIA's security concept for ID documents

IDEMIA's security concept for identity documents empowers the fight against fraud and enables new usages for today and beyond.

For governments, providing citizens with tamper-proof ID documents is key in the fight against illegal activities. Identity document fraud regularly evolves as fraudsters gain access to sophisticated equipment. It takes different forms including counterfeiting, forgery, use of stolen blank document, imposter using someone else's document, and Fraudulently Obtained but Genuine documents (FOG).

IDEMIA provides solutions to efficiently **protect the portrait, interlink data**, and insert features for **optical machine authentication**. The combination of these three pillars is ideal to ensure that ID documents are hard to reproduce but easy to inspect.
